

Installation Guidelines – Sheffield Cycle Stand

These instructions are intended as guidelines only. Citysquared recommend employing experienced professionals for any installation.

<p>1.0</p> <p>The cycle stand is fitted by core drilling a hole for each leg. Ensure the product is positioned avoiding any under-floor services. Measure the distance to the centre point of each leg and mark out on the floor.</p> 	<p>2.0</p> <p>Using an appropriate diamond core drill (check diameter of legs), drill approximately 300mm into the hard surface to achieve a cycle stand height of around 800mm. Citysquared recommend an adjustable rig be used in conjunction with the drill to ensure the cycle stand remains perpendicular to level.</p> 
<p>3.0</p> <p>Ensure the hole is clear of waste material (or water if a wet drill is used). Check the depth of each hole is adequate.</p> <p>Using a polyester resin (e.g. Instarmac, Ultracrete PY5) bond the legs into the prepared hole. Observe the manufacturers application procedures and curing times.</p>	<p>4.0</p> <p><i>Please note all installations need to be into a hardstanding.</i></p>
